Source code formatted with the minted package

The `minted` packages gives you nicely formatted source code right without any manual styling neccessary:

```java
class Example {
    public static void main(String[] args) {
        int i = 123;
        /* A code example */
    }
}
```

You can also load a source code file directly from a document or an URL:

```python
class Example:
    """A code example"""
    def hello():
        return 'Hello world.'
```

You can use the \texttt{...} command for quick inline code snippets without any highlighting. If you need syntax highlighting, use the \mintinline{lang}{code} command. By adding the breaklines option \mintinline[breaklines]{lang}{code} you can make sure that the code wraps over multiple lines.

The minted package depends on the helper program `pygments` to work properly. Because of this you need to compile your .tex file with the `-escape-shell` flag to work properly.
